VG7 PRINT

Quick, easy and error-free printing estimates with the VG7 configurator

Create quick and easy printing estimates for a large variety of products: small format, large format, paper converting and screen printing.

VG7 provides an advanced calculator, which compares any type of technology (digital, offset, etc.) to offer you the optimal economic solution in terms of cost and revenues, as well as the most efficient technical solution, improving the yield as needed.

The print configurator adapts to the business model of your company, thanks to a wide range

of customizations and the possibility to set different calculation methods for each economic component of the estimate (calculation by number of sheets, by frame, by number of strokes, etc.).

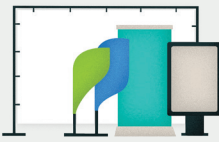

With the print configurator, you can manage printing machines, materials and waste, as well as finishing and binding processes. Furthermore, you will have the possibility to use the advanced estimate settings, allowing you to manage pantones, varnishes, hardcover covers, fixed print yields and much more.

VG7 supports various printing technologies for pricing a product

Offset and digital printing

Sheet or web fed, for the small format.

Roll to roll and flatbed machines

In linear meters or square meters, for the large format.

Pad printing and screen printing

Calculation by square meters or hours, for gadget products customization.

Printing and coupling

Print the various components and couple them with corrugated materials, for paper converting products.

Multi-subject and multi-quantity estimates

Multi-subject estimates: This feature allows the same estimate to be calculated for multiple subjects at the same time, with the results displayed on a single page. In addition, different quantities can be specified for each subject.

Multi-quantity estimates: This feature allows the same estimate to be calculated for multiple quantities at the same time, with the results displayed on a single page. This feature is useful when it is necessary to send the customer an estimate with multiple runs.

Dynamic calculation of estimates

The VG7 Calculation Engine, thanks to advanced computation algorithms, is able to optimize every aspect of the product realization.

According to the parameterization performed at the technical-economic level of each process, the Calculator is able to obtain results with different printing technologies in order to determine the most economically advantageous and efficient solution for the realization of the job.

Notifications to the customer and to the supplier

The notification e-mails are of different types and can be generated automatically or sent manually. Thanks to this feature, customers and suppliers will always be up-to-date regarding the status of their orders and payments. Specifically, they will be able to receive confirmation of registration on the website integrated in the management system, order confirmation, feedback on graphic file control, tracking of the package or product ready for collection.

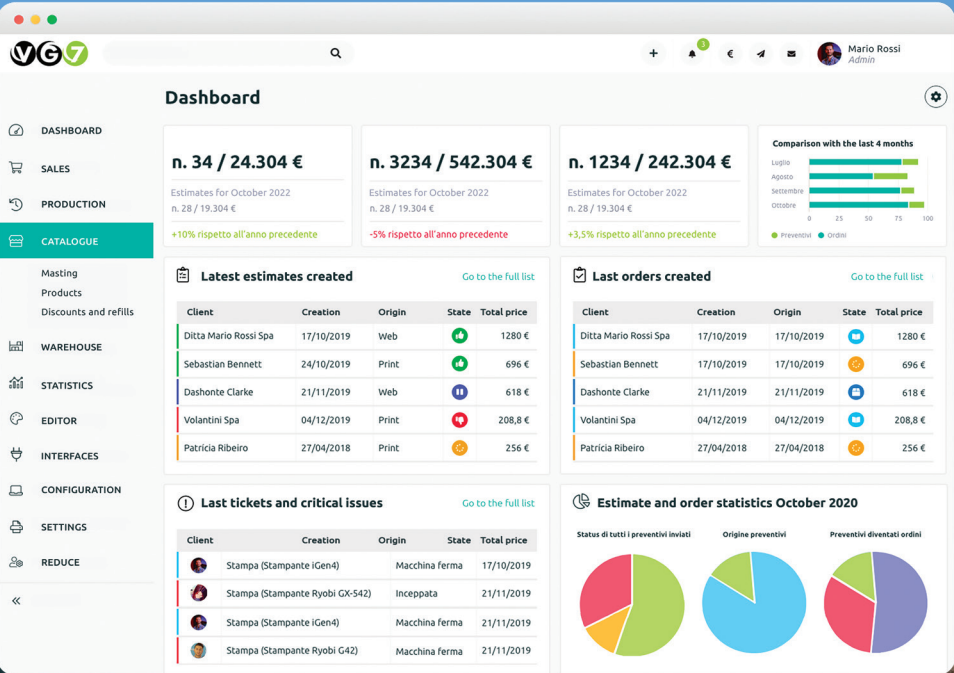

Generation of processing sheets

The management system allows the internal user to create processing sheets as PDF files. These, generated automatically by the system when an order is processed, can be sent to the various production departments and printed if necessary. Their function is to summarize, on a technical level, the processing steps to be performed and the material to be taken from the warehouse.

Management of production waste

With the management software it is possible to manage the waste of sheet and roll materials, both in a general and specific way, for each material. It also allows the configuration of the waste by press sheet for the small format, both for the printing phase and for any other finish following or preceding it.

“ Save time, speed up the process and maximize the result with the advanced calculator ”

VG7 Dashboard

Print file archiving

Thanks to this functionality, one or more print files correspond to each line of the order. The graphic file can be uploaded manually by the person managing the job or directly by the customer via the website. The customer can upload them from his personal area, in a confirmed order, and monitor any graphical control of the file.

Management of the economic components

This function allows you to define a price list with the purchase cost or internal cost and the respective sales price for each machine, material and finish. This allows you not only to have total control over costs / revenues, but also to obtain correct and significant final reports.
